1. The preliminary amendment filed has been entered. Claims 1-17 have been canceled. Claims 18-66 are now pending.
2. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
5. Claims 18-66 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hsiung et al US 2003/0083756.

Art Unit: 2876

Hsiung discloses a Windows equipped PC [0453], running Microsoft Excel [0365]. PCs inherently include processors and connected memory. Excel includes problem solving capabilities responsive to variables in the form of predefined and user defined functions, i.e. constructed data structures held in memory. Excel, through the use of the processor, calculates the results of the calculation from the input values for the variables. Hsiung does not specifically disclose the probability calculation. However, calculations to determine the probability of a variable satisfying a desired condition or constraint are old and well known, as is problem solution state. It would have been obvious to a person of ordinary skill in the art at the time of the invention to compute the "probability" in order to allow a person reviewing the data to determine the applicability of the data processed. Excel further includes both graphing and listing capabilities. Excel displays "warning" messages when a variable is not within acceptable range, and produces appropriate "warning" messages for specific "unacceptable" conditions. Excel can be configured to return integer values.
